

FIELD
AVIATION

Benefits

- Attractive, modern design
- Easily movable by cabin crew

Kit Content

- LH & RH class divider
- Mounting rails (if required)
- All installation hardware
- Installation data package
- Certification documentation

Installation

- Approximately 50 man-hours are required to install the rails
- Dividers are installed in minutes once rails are mounted

Typical Lead Time

- 12 weeks ARO

Certification Basis

- TC STC
- EASA STC

Cabin Class Divider

DHC-8 200/300 • CRJ 200

The FIELD AVIATION Cabin Class Divider provides a visual separation for two-class service in the passenger cabin.

The cabin class divider assembly consists of a clear polycarbonate panel that allows the flight attendants a clear view of all seat rows. As an option, a company or airline logo can be etched on the clear portion of the divider, however the pattern must be approved to ensure visibility is not adversely affected.

The cabin class divider attaches to two mounting rails that are installed under the left hand and right hand overhead storage bins.

The divider can be installed at the seat back of any row, except immediately forward of the mid-cabin emergency exits. It can be installed at the last seat row, immediately forward of the aft bulkhead, for storage when dual class service is not required.
